Wallet Setup & Faucet

## Step 1: Setup your wallet

I use Eternl which you can get here:

https://eternl.io/

Before you create a wallet, switch to the "Pre-prod" network. You do this by clicking this button at the bottom right of the wallet app:

You'll then be shown this popup:

Switch Network

✕

Cardano   APEX

Cardano Mainnet
The official Cardano network launched by IOG in 2017.

●

─────────── Test Networks ───────────

Pre-Production Testnet
A pre-production testnet that mimics mainnet parameters. A good playground for newcomers as well as more experienced users when testing Cardano integrations or learning how to operate a stake pool.

Preview Testnet
A network for testing release candidates and mainnet releases. Leads mainnet hard forks by at least 4 weeks. If you want to test the latest features, this is the place to do it.

Guild Network
A testnet created and operated by Guild Operators community group with a short epoch for rapid development and testing.

https://cardano-community.github.io/guild-operators/#/ ⧉

SanchoNet
SanchoNet is a Cardano testnet aimed to lead the way to on-chain governance.

https://sancho.network/ ⧉

Select "**Pre-production Testnet**" and then click on "**Add Wallet**" to begin:

Follow the process carefully, and immediately note down your password, and your secret keys. Once you're done you'll be able to go to the "**Receive**" tab to copy your wallet address to clipboard for the next step.

Step 2 - Get some funds into your wallet

Before you can test our platform you'll need some test ADA. The faucet below will currently give you 10,000 ADA. Paste your wallet address into the form and you should receive those test funds in less than a minute:
